

### Demo session

Each team will have c. 5 minutes for presentation. Few minutes are needed and used between times to perform the switch. Presenters have to come to the front of the room to use the large screen.

Recommended presentation structure:

- introduce team: team name and members; introduce presenter(s)
- Overview of the application and its features
- Show basic functionality and then the selected distributed features (especially if they system behavior changes)

You can combine slide presentation and system demo. If combined, usually it is better to have a short (1-2 min.) slide presentation first and then demonstrate the key features.

It is fine to have only a demonstration without slides. If the system does not work yet, then you can have only a slide presentation during exercise session and short video demo containing the working features attached to the final report.

Recall the grading principles from Project description:

Points 1-5 will be given based on the coverage of features in the demonstration/video, as well as clarity of the demonstration. The demonstration clarity does not contain fancy features or technical video editing features, but the flow of presentation, expectations of the audience knowledge level, etc features of a good oral presentation.

Room facilities:

Connect to the screen can be done either using via system or with hdmi-cable (The room might have also other connection options, but have not checked them)

Instead of just one screen, you can have multiple screens for different parts of the applications. Remember that each screen has to be controlled by different device. Only the main screen(s) can use hdmi, the rest use only via system.

Presentation order:

This will agreed during the presentation session

If all presentations do not fit to Wednesday, then also Thursday lecture can be used for some demos.
